

FAN SUPER — FAN LAB (v1.4)

Tam Proje Ağacı, Başlık Başlık Dosya Yolları, Gradle, Kaynak Kodlar ve Geçmiş Veriler

🌐 Kotlin Meclisi (8 Üye) + 🐍 Python Meclisi (10 Üye, Chaquopy 3.11) + ⚖️ Baş Hakem & v1.3/v1.4 Meta-Ensemble (FanBrain)

Dört Satırlı Mavi Overlay (K · Py · Kısa YAN · RAKAM) | Konformal Tek/Çift Kararı | Room/SQLite Hafıza | 893 Canlı Veri Kaydı

PROJE VE REPOSITORY KİMLİĞİ

Repository / Kök:	hsyn8144/FanSuper-FANLAB
Uygulama Paketi:	fan.superai (v1.4 · versionCode = 5)
Git Dalı / Etiket:	arena/01a0f91c-fansuper-fanlab · v1.4-build11
Commit Özeti:	2259415696ae9ec23ae7494b9b94e5d7932b456e
Derleme Ortamı:	Android SDK 34 (min 26) · Kotlin 1.9 · Chaquopy 15
Belge Tarihi:	2026-10-01 (UTC)

ARŞİV KAPSAMI VE İSTATİSTİKLER

Toplam Dosya:	84 Dosya (81 Metin/Kod + 3 İkili/Görsel)
Toplam Satır:	14.078 Satır (%100 Kısıltımsız Tam İçerik)
Toplam Boyut:	1.565.206 bayt (1.49 MB)
Kotlin Kodları:	35 Ana Kaynak + 7 Test = 42 Kotlin (.kt)
Python Kodları:	3 Ana Modül + 2 Test = 5 Python (.py)
Geçmiş Veriler:	893 Canlı Kayıt + 1 Başlık = 894 Satır × 76 Sütun

FAN SUPER v1.4 SÜRÜM ÖZETİ VE MİMARİ BİLEŞENLER

- Overlay (4 Satır, Mavi Kart): En üstte K (Kotlin rakam), altında Py (Python rakam; yoksa '--'), altında YAN (kısa: B•T / K•Ç), en altta RAKAM (nihai çıktı, çiftte 1/2).
- Otomatik Tek/Çift (Konformal Kararı): Ayarlar → 'Çift tahmin kararı' (Otomatik / Her zaman çift / Her zaman tek) FanBrain'e taşındı; 1 – p[gerçek] (son 300) %50 eşiğiyle çalışır.
- Yüzdelik Eşik Düzeltmesi: Ayarlar → 'Yedeğe düşme eşiği' Float yuvarlama hatası giderildi; değer tam metin olarak saklanır ve seçilen yüzde etiketini doğru gösterir.
- Kalıcı Hafıza ve Hızlı Geri Alma: Room/SQLite (9 tablo) + O(1) geri alma (Kotlin + Hakem + Python referans/checkpoint görüntüsü) ve sızıntısız kronolojik Replay.
- Bu PDF Arşivi: Repo içindeki 84 dosyanın tamamını; proje ağacı, tam dosya yolları, Gradle betikleri, Kotlin/Python kodları, görseller ve 894 satırlık CSV verileriyle içerir.

BÖLÜM BAZLI PROJE İÇERİK TABLOSU (BAŞLIKLAR ÖZETİ)

1 # FAN SUPER v1.4
2
3 Tek uygulamada iki meclis: Kotlin Meclisi (8 üye) ve Python Meclisi (10 üye, Chaquopy ile uygulamaya gömülü).
4 İki meclis kendi içinde Fixed-Share Hedge ile yarışır; Baş Hakem (stacking + kalibrasyon + konformal tek/çift kararı)
5 uygulama içinde tek bir rakam tahmini ve tek bir yan tahmin (T/Ç • K/B) üretir.
6 Overlay ise v9.6 mavi kartının Kalıp satırı çıkarılmış halidir; Kotlin ve Python tahminlerini ayrı gösterir.
7
8 - Sürüm: 1.4 (versionCode = 5)
9 - Paket: fan.superai (super Java/Kotlin'de ayrılmış kelime olduğu için fan.super.ai kullanılamaz)
10 - Hazır veri: app/src/main/assets/fan_data_live.csv (893 kayıt) ilk açılışta yüklenir.
11
12 ## Meclisler
13 | Kotlin | Python |
14 |---|---|
15 | Kalıp Arama 2.0 (6 görünüm × 30 uzunluk, hash indeksli) | LSTM (BPTT) |
16 | CTW (Context Tree Weighting) | Mini Transformer (dikkat / induction head) |
17 | PPM-C | 1D-CNN |
18 | Frekans / Aralık (hazard) | Kalıp 2.0 bulanık (1 fark + ayna) |
19 | Seri / Dalga | KNN-DTW |
20 | Rejim | Spektral + BOCPD |
21 | GRU (BPTT) | Gradient Boosting |
22 | ESN | Bağlam modeli • Motif keşfi • HMM |
23
24 ## Ekranlar
25 Ana • Meclisler (Kotlin / Python / Yan) • Keşif Laboratuvarı • Grafik • Ayarlar
26
27 ## Derleme
28 GitHub Actions (.github/workflows/build.yml) her push'ta APK üretir; main dalında Releases altına da koyar.
29 Yerelde: JDK 17 + Python 3.11 kurulu iken ./gradlew assembleDebug.
30
31 ## Overlay kullanımı ve testler
32 Varsayılan dikey kartın sırası (v1.4):
33 1. K – Kotlin meclisinin rakam tahmini (1/2 gibi)
34 2. P – Python meclisinin rakam tahmini (Python yoksa --)
35 3. YAN – nihai yan tahmini, kısa: B•T, K•Ç gibi
36 4. RAKAM – nihai rakam tahmini (çift kararda 1/2)
37 5. Son 6 veri, en yeni veri solda
38 6. DEL → 4 → 3 → 2 → 1, tam genişlikte ve alt alta
39
40 Kalıp ve hakem/meclis detayları overlay'de gösterilmez; uygulamanın içindeki
41 meclisler, modeller, veriler, öğrenme ve geri alma işlemleri değişmemiştir.
42 Tahmin satırlarından, son sayılardan veya kartın boş kenarlarından tutup sürükleyin.
43 Sürükleme için uzun basmayı beklemek gerekmez; sayı/DEL düğmeleri veri girişi içindir.
44 Yatay yerleşim ayarı korunur: dört tahmin satırı solda, düğmeler sağdadır.
45 Saydamlık, yazı boyutu, son sayı dizisini gösterme ve titreşim ayarları korunur.
46
47 Tahmin kaynağı: K/Py rakamları doğrudan ilgili meclisin rakam eksenindeki grup
48 karışımıdır. Kaç aday gösterileceği Ayarlar → "Çift tahmin kararı" ile belirlenir:
49 Her zaman tek yalnızca ilk adayı, Her zaman çift ilk iki adayı gösterir;
50 Otomatik ise konformal kuralı kullanır (1 – p[gerçek] skorlarının %50 kapsama eşiği,
51 son 300 değerlendirme). Karar nihai tahminle birlikte kilitlenir ve kilit bağlamıyla
52 saklanır; geri yüklemde aynı gösterim yeniden üretilir. Overlay yüzdeleri ilgili
53 adayların ham olasılık toplamıdır; nihai güven kalibrasyonludur. Yan tahmini her meclisin
54 kendi dağılımından türetilir; yan yüzdesi tek/çift ve küçük/büyük güvenlerinin ortalamasıdır.
55 Python hazır/aktif değilse Py satırı -- gösterir; Kotlin veya hakem sonucu Python tahmini
56 gibi gösterilmez.
57
58 Son veriler yalnızca gösterimde ters çevrilir, motor geçmişinin sırası değişmez.
59 Bekleyen girişlerin motor tarafından işlenmiş bölümü tekrar eklenmez; böylece motor
60 hesap yaparken son 6 satırında aynı giriş iki kez görünmez.
61
62 Overlay dokunma regresyon testleri: ./gradlew testDebugUnitTest.
63 GitHub Actions bu testleri APK derlemesiyle birlikte çalıştırır ve test raporlarını
64 overlay-test-reports, kurulabilir APK'yı FAN_SUPER_APK, kaynak paketini
65 FanSuper_v1.4.zip olarak FanSuper_SOURCE artifact'ında saklar (main'de ayrıca Release'e konur).
66 ZIP içinde yalnızca çalışan v1.4 kaynakları ve veri/fan_data_live.csv (sadece eski kayıtlar)
67 bulunur; APK, log, anahtar, yerel ayar ve build klasörleri pakete girmez. Paket hem
68 Android Studio hem Code on the Go ile içe aktarılabilir: ZIP'i açıp FanSuper_v1.4/ klasörünü açın.
69
70 Yüzdelik ayar (Ayarlar → Yedeğe düşme eşiği) tam değer olarak saklanır; seçim etiketi
71 seçilen yüzdeyi gösterir (Float yuvarlaması nedeniyle ham sayı görünmesi v1.4'te giderildi).
72
73 ## Veri girişi düğmeleri ve hızlı geri alma (⌘ / DEL)
74 - Anında geri bildirim: Sayı düğmesine basıldığı anda rakam "Son 6" satırında görünür;
75 motor hesabı arka planda sırayla işlenir. Motor henüz hazır değilse (ilk açılış) girişler
76 kuyruğa alınır, hiçbir basış kaybolmaz. Kaç işlemin sırada olduğu Ana ekranda gösterilir.

```

[Dosya #01/84 — Devam] Proje Yolu: README.md (Satır 77 ve sonrası)

```

77 - **Düğmeler her zaman ekran içinde:** Kart artık ekran genişliğini aşamaz; yatay görünümde
78 tahmin satırı daralır, sürükleyince kart ekran dışına çıkarılamaz. Böylece 1/2/3/4 ve DEL
79 düğmeleri ulaşılabilir kalır.
80 - **0(1) geri alma:** Her adım için küçük bir geri alma kaydı tutulur (Kotlin meclisi + hakem
81 + Python meclisi). ¯ artık tüm geçmişi baştan öğrenmez, milisaniyeler içinde biter ve
82 veriyi birebir eski haline döndürür. Python tarafında adım başına derin kopya (deepcopy)
83 kaldırıldı; bunun yerine referans tabanlı görüntü + dayanak (checkpoint) kullanılır,
84 durum dosyasıyla birlikte saklanır (uygulama yeniden açıldığında ilk geri alma da hızlıdır).
85 - Kayıt yığınının dışında (64+ adım derin) geri alma yapılırsa motor doğru sonucu vermek için
86 tam yeniden kurmaya düşer; bu normaldir ve logcat'te `undo ... (tam yeniden kurma gerektiği)`
87 olarak görünür.
88
89 Python geri alma testleri (yerelde): `pip install "numpy<2"` sonra
90 `python app/src/test/python/test_fan_super.py -v`.
91
92
93 ### v1.2 FAN LAB
94 The project now includes a research/validation layer that reports chronological walk-forward performance, bootstrap confidence i
95 ntervals, permutation benchmarks, log loss, Brier score, entropy, calibration gap, member disagreement and Jensen-Shannon divers
96 ity. These metrics are diagnostic; they do not guarantee predictive advantage on a future random process.
97
98 ### v1.3 — meta-ensemble, kalıcı hafıza, replay
99 - Tek nihai tahmin: tek rakam + tek yan (BÜYÜK/KÜÇÜK + TEK/ÇİFT). Overlay'de iki satır (RAKAM, YAN); Kotlin/Python ayrıntısı FAN
100 LAB'da.
101 - Room/SQLite kalıcı hafıza; açılışta yalnızca yeni kayıtlar işlenir; "Full Replay" yalnızca ilk kurulum, durum bozulması ya da
102 elle.
103 - Yan tahmin rakamdan türetilmez; Python Kalıp Arama 2.0 hem Büyük/Küçük hem Tek/Çift eksenine girer.
104 - Replay (RESEARCH modu) sandbox'ta çalışır; sızıntı denetimi, bootstrap/permutation, baseline ve karşı-olgusal analiz içerir.
105 - Ayrıntılı teknik notlar: `FANLAB_TECHNICAL_NOTES.md` (v1.3 bölümü). Hata kodları `FAN-E-*`, olay günlüğü `NEW_RECORD ... REPLAY_
106 COMPLETED`.
107 - Python testleri: `pip install "numpy<2"` ardından `python app/src/test/python/test_fan_super.py -v` ve `test_fan_side.py -v`.

```

1 # Sürüm notları
2
3 ## 1.4 — 2026-10-01
4 Overlay yerleşimi + iki hata düzeltmesi. v1.3'ün hiçbir özelliği kaldırılmadı.
5
6 **Overlay (dört satır, aynı mavi kart)**
7 - En üstte **K** — Kotlin meclisinin rakam tahmini; altında **Py** — Python meclisinin rakam tahmini.
8 - Altında **YAN** — nihai yan tahmini artık KISA: `B•T`, `K•Ç` gibi (eski "BÜYÜK + TEK" uzun yazım kaldırıldı).
9 - En altta **RAKAM** — şimdiye kadar ekranda olan nihai çıktı (çift kararda `1/2`).
10 - K/Py satırları ilgili meclisin kendi grup karışımından beslenir; Python hazır/yok ise `--` gösterir,
11 Kotlin veya hakem sonucu Python satırına kopyalanmaz.
12 - Dikey kartta düğme grubu panelden artan yüksekliği alır: dört satır eklendikten sonra da
13 DEL/4/3/2/1 kısa ekranlarda kart içinde kalır. Yatay yerleşim korunur.
14
15 **Düzeltilmeler**
16 - **Yüzdelik seçimi (Ayarlar → Yedeğe düşme eşiği):** değer Float olarak saklandığı için
17 0.18 → 0.18000000715255737 oluyor ve seçim etiketi bulunamayıp ham float yazılıyordu.
18 Değer artık tam (metin) saklanıyor, seçenek eşleştirmesi toleranslı; eski kurulumlar da okunur.
19 - **Otomatik tek/çift mekanizması:** "Çift tahmin kararı" (Otomatik / Her zaman çift / Her zaman tek)
20 yalnızca eski hakemi etkiliyordu; nihai v1.3 tahmini ve overlay etkilenmiyordu. v1.4'te konformal
21 karar FanBrain'e taşındı: 1 — p[gerçek] skorları (son 300) %50 kapsama eşiğiyle değerlendirilir,
22 karar kilit bağlamıyla saklanır. Rakam/güven tek kararda tek aday, çift kararda ilk iki aday üzerinden
23 hesaplanır; Python meclisi karara katıldığında skorlar ortak güncellenir.
24
25 **Sürüm/paketleme**
26 - `versionCode = 5`, `versionName = "1.4"`.
27 - Workflow artık `FanSuper_v1.4.zip` içinde YALNIZCA çalışan kaynakları (izlenen dosyalar) ve
28 `veri/fan_data_live.csv` (sadece eski kayıtlar) paketler; APK/log/anahtar/yerel ayar/build klasörü
29 bulunmadığını denetler. Ana ekran ve FAN LAB sürüm etiketi v1.4.
30
31 ## 1.1 — 2026-09-27
32
33 - Onaylanan eski mavi overlay düzeni: Kotlin rakam, Python rakam, Kotlin yan ve Python yan.
34 - Kalıp ve hakem/meclis detayları overlay'den kaldırıldı; uygulama içindeki modeller değişmedi.
35 - Son 6 veri en yenisi solda; hızlı girişlerde işlenmiş kayıtların tekrar gösterilmesi önlendi.
36 - Dikey kartta DEL, 4, 3, 2, 1 tam genişlikli ve alt alta; yatay ayarı korunuyor.
37 - Tahmin alanı/son sayılar/kenarlardan sürüklemeye; yeniden ölçüm sonrası ekran içine sığdırma.
38 - Tahmin kaynağı, Python yokluğu, veri sırası, dokunma ve yerleşim regresyon testleri eklendi.
39 - versionCode 2; sürümlü APK, kaynak ZIP ve SHA-256 dosyaları workflow tarafından üretilir.
40
41
42 ## 1.2
43 - FAN LAB research screen added.
44 - Chronological walk-forward reporting from prediction logs.
45 - Bootstrap confidence interval for Top-1 accuracy.
46 - Permutation benchmark against shuffled outcomes.
47 - Log loss, Brier score, entropy and calibration-gap metrics.

```

[Dosya #02/84 — Devam] Proje Yolu: CHANGELOG.md (Satır 48 ve sonrası)

```

48 - Ensemble member disagreement and Jensen-Shannon diversity metrics.
49 - Recent-window performance and research rerun action.
50 - Existing prediction, council, discovery, chart, overlay and undo flows preserved.
51
52
53 ## 1.3 — 2026-10-01
54 Araştırma / öğrenme / replay / ensemble sistemi. v1.2'de çalışan hiçbir özellik kaldırılmadı.
55
56 **Tek nihai tahmin**
57 - Kotlin + Python (rakam ve yan) çıktıları ortak olasılık dağılımı biçiminde olasılık seviyesinde birleştirilir (probability-level meta-ensemble).
58   Ağırlıklar: performans (log-skor kazancı, uzun/kısa EWMA), kalibrasyon, rejim, örnek sayısı, model çeşitliliği (korelasyon/uyum/JSD).
59 - `FinalPrediction`: tek rakam + tek yan (1 BÜYÜK/KÜÇÜK + 1 TEK/ÇİFT), dağılımlar, güven, entropi, rejim, ensemble sürümü, zaman damgası, kilit kimliği.
60 - Yan tahmin rakamdan türetilmez: BS ve OE için ayrı Kotlin motorları (frekans, son pencere, Markov, seri, rejim koşullu, kalıp) +
61   Python yan meclisi (**Kalıp Arama 2.0 dahil — her iki eksende**, n-gram, lojistik) + birleşik 4'lü analiz.
62 - Rakam alfabesi 1..4 (N=4); rastgele baseline rakam %25, yan %50, birleşik %25.
63
64 **Kalıcı hafıza (Room + SQLite)**
65 - Tablolar: FanRecord, PredictionRecord, ModelState, ModelPerformance, RegimeState, CalibrationState, EnsembleState, ReplayState, PredictionExplanation.
66 - CSV artık ana veritabanı değildir (ilk kurulum aktarımı / dış aktarım / yedek). v1.2 kullanıcılarının CSV'si ilk açılışta DB'ye aktarılır.
67 - Açılışta yalnızca yeni kayıtlar işlenir (durum parçaları + Python örnek yüklemesi). Tam replay yalnızca ilk kurulum, bozuk/uyuşmayan durum veya elle "Full Replay" durumunda.
68 - Her kayıta DB baştan yazılmaz: yalnızca değişen durum parçaları yazılır; son 8 geri alma anlık görüntüsü DB'de.
69
70 **Replay, sızıntı koruması, tekrarlanabilirlik**
71 - Kronolojik replay: geçmiş → tahmin → LOCK → gerçek sonuç → değerlendirme → öğrenme. Gelecek veri fiziksel olarak erişilemez (önek kopyaları).
72 - Kilit: predictionTimestamp, predictionSequence, lastKnownRecordId, kilit özeti (CRC); yeniden başlatmada kilit yeniden üretilir ve doğrulanır.
73 - LIVE ve RESEARCH/REPLAY modları ayrı (sandbox brain + Python sandbox_replay).
74 - Bootstrap güven aralıkları, permutation testleri, baseline'lar, karşı-olgusal (Python yok / Kotlin yok / ağırlık ±%10 / eşit ağırlık; gerçek state'e yazmaz).
75
76 **Açıklamalar**: yalnızca gerçek hesaplardan (grup favorileri, rejim isabeti, kalibrasyon, geçiş matrisi, seri, entropi, model anlaşmazlığı).
77
78 **Arayüz**: overlay tasarımı korunarak 4 satır → 2 satır (RAKAM + YAN, örn. `BÜYÜK+TEK`); Kotlin/Python ayrımı FAN LAB'a taşındı.
79
80 FAN LAB 8 sekme: Overview (v1.2 araştırma içeriği + sayfalı tahmin geçmişi), Models, Side Analysis, Replay, Calibration, Diversity, Regime, Counterfactual.
81
82 **Testler**: v1.3 çekirdek (sızıntı örnek-değişmezliği, replay sırası, tekrarlanabilirlik, kilit, kalıcılık, artımlı = tam replay, undo, yan iki bileşen, rakam aralığı, tek dağılım, karşı-olgusal), Room (Robolectric), Python yan meclis testleri. versionCode 4.
83

1 # Bu paket için yapılan düzeltmeler
2
3 ## 1) Overlay döndürme/hizalama düzeltmesi
4 `OverlayService.kt`'ye `onConfigurationChanged` eklendi. Ekran döndürüldüğünde kart artık
5 zorla yeniden ölçülüp ekran içine sığdırılıyor — önceden bu yalnızca kartın KENDİ boyu
6 değiştiğinde tetikleniyordu, ekran boyu değiştiğinde değil.
7
8 ## 2) Hızlı art arda tuşlamada "echo" sayaç kayması
9 `EngineHost.kt` / `Echo`: anlık geri bildirim listesi ekranda son 6 sayıyla sınırlı olsa da
10 (`takeLast(6)`), bekleyen toplam işlem sayısını artık ayrı bir `pendingCount` alanı takip
11 ediyor. Önceden 6'dan fazla hızlı tuşlamada bu sayaç kırılan listenin boyutundan
12 hesaplanıyordu ve nadir durumlarda ekranın erken/geç senkron olmasına yol açabiliyordu.
13
14 ## 3) Python köprüsü: JSON'suz sıcak yol
15 `fan_super.py`'de `step_fast` ve `undo_to_fast` eklendi (mevcut `step`/`undo_to` JSON'lu
16 haliyle, testler için ve geriye dönük uyumluluk için AYKEN duruyor). `PythonBridge.kt`
17 artık her tuşlamada bu hızlı yolu kullanıyor: `json.dumps` + `JSONArray` ayrıştırma
18 maliyeti olmadan, Chaquopy'nin otomatik liste dönüşümüyle doğrudan `DoubleArray` alıyor.
19 Python tarafındaki 7 birim test ayne geçiyor (davranış değişmedi, sadece taşıma biçimi).
20
21 ## 4) Detaylı işlem logu ekranı
22 - `EngineHost.kt`: her `EKLE`/`GERİ AL` işleminde o anki hakem kararı + her üye modelin
23 (🎯 Kotlin ve 🐍 Python meclisi) top1/top2/ağırlık bilgisini `ActivityLogEntry` olarak
24 bellekte tutan `activityLog` (son 500 kayıt) eklendi. Ekstra hesap yok — motor bu veriyi
25 zaten her adımda üretiyor.
26 - Yeni `LogScreen.kt`: Ayarlar → "📋 İşlem logları" ile açılır, her satır tıklanınca o
27 adımdaki tüm üye modellerin tahminini gösterir. `SettingsScreen.kt`'ye giriş noktası
28 eklendi.
29 - Bonus: "GERİ AL" logu, geri almanın "anında" mı yoksa "tam yeniden kurma" (yavaş yol)

```

[Dosya #03/84 — Devam] Proje Yolu: DUZELTMELER.md (Satır 30 ve sonrası)

```

30 ile mi tamamlandığını da gösteriyor – bu, geri alma tuşuyla ilgili olası Python
31 senkron sorunlarını adb logcat açmadan doğrudan uygulama içinden teşhis etmenizi sağlar.
32
33 ## ÖNEMLİ — APK derlemesi hakkında
34 Bu ortamda (kod asistanının sanal makinesi) Android SDK yok ve ağ erişimi yalnızca
35 birkaç paket deposuna (PyPI, npm, GitHub vb.) izin veriyor; `services.gradle.org` ve
36 Google'ın Maven deposu (`dl.google.com`) erişime kapalı. Bu yüzden burada
37 `./gradlew assembleDebug` çalıştırıp size APK üretmedim (denedim, Gradle dağıtımını
38 bile indiremedi). Kodu derlemeden gönderiyorum – Python tarafındaki 7 testi burada
39 çalıştırıp geçtiğini doğruladım, ama Kotlin/Android tarafını gerçek bir Android
40 araç zinciriyle SİZİN derlemeniz/test etmeniz gerekiyor.
41
42 İki kolay yol:
43 1. **GitHub Actions (önerilen, elinizde zaten var):** Bu projeyi bir GitHub reposuna
44 push edin – `.github/workflows/build.yml` otomatik olarak APK üretip
45 `FAN_SUPER_APK` adıyla Actions sekmesinde, main dalında ayrıca Releases'e koyuyor.
46 2. **Android Studio:** Bu zip'i açıp projeyi Android Studio'da açın, JDK 17 + Python 3.11
47 kurulu olduğundan emin olun, `./gradlew assembleDebug` (veya Studio'nun "Run" düğmesi).
```

1 # FanSuper v1.2 — FAN LAB teknik notları
2
3 ## Bu sürümde eklenenler
4
5 - Kronolojik, leakage-free tahmin kayıtları: her StepLog tahmin olasılıklarını gerçek sonuç öğrenilmeden önce saklar.
6 - Walk-forward raporlama: motorun gerçek zamanlı öğrenme sırasındaki tahmin serisini ölçer.
7 - Top-1 / Top-2 ölçümleri ve %25 random baseline.
8 - Bootstrap %95 güven aralığı.
9 - Permutation testi ve percentile ölçümü.
10 - Log loss, Brier score, entropy ve calibration gap.
11 - Ensemble üyesi disagreement oranı.
12 - Üye olasılıkları arasında ortalama Jensen-Shannon diversity.
13 - Son 100 tahmin için performans ve log-loss.
14 - FAN LAB ekranı ve yeniden çalıştırma düğmesi.
15 - Uygulama sürümü 1.2 olarak yükseltildi.
16
17 ## Mevcut mimari korunmuştur
18
19 Kotlin Council, Python Council/Chaquopy, Referee, Discovery, Charts, Overlay, DataStore ve Undo akışları kaldırılmadı. FAN LAB m
20 evcut motorun oluşturduğu kronolojik kayıtları analiz eder.
21
22 ## Doğrulama
23
24 - Python undo/state testleri: **7/7 OK**.
25 - Analytics çekirdeği, Android bağımlılıklarından ayrılmış olarak `kotlinc` ile derlendi ve örnek veri üzerinde çalıştırıldı.
26 - Bu ortamda Gradle dağıtımını internetten indirilemediği için tam Android APK build'i burada doğrulanamadı. Code On The Go / And
27 oid Studio Gradle wrapper üzerinden ilk build alınmalıdır.
28
29 ## Yorum
30
31 FAN LAB istatistikleri gelecekteki bir veri kaynağında avantaj garantisi değildir. Özellikle veri gerçekten bağımsız ve adil ras
32 tgele ise modellerin geçmişteki küçük örneklerde yüksek görünmesi gerçek bir öngörü gücü anlamına gelmeyebilir.
33
34 ## v1.3 — Teknik notlar
35
36 ### Alfabe ve problem ayrımı
37 Gerçek veri 1..4 rakamlarından oluşur (N=4). BS: 0=KÜÇÜK (1,2), 1=BÜYÜK (3,4). OE: 0=ÇİFT, 1=TEK. Birleşik: bs*2+oe.
38 Rakam ve yan ayrı problemlerdir; yan modeller ayrı BS/OE/COMB dizilerinden öğrenir, rakam tahmininden türetilmez.
39
40 ### Akış
41 `predict → LOCK → gerçek sonuç → değerlendir → online öğren → rejim/kalibrasyon/ağırlık → persist → yeni predict+LOCK`.
42 Kilit açıkken ikinci tahmin üretilmez. DEL: önceki anlık görüntüye dönülür; aynı kilitli tahmin geri gelir.
43
44 ### Meta-ensemble
45 Her eksen (NUMBER, BS, OE, COMB) için ayrı `AxisEnsemble`. Üye skoru: log-skor kazancı (uzun  $\alpha=0.01$  / kısa  $\alpha=0.06$  EWMA) + rejim
46 kazancı
47 (n/(n+20) büzülmeli) – kalibrasyon cezası; örnek ve korelasyon çarpanları; ağırlık yumuşatma 0.10; alt sınır 0.15/n.
48 Lineer olasılık havuzu + öğrenilen sıcaklık  $\tau \in [0.5, 1.5]$  (argmax'ı değiştirmez). Yan: BS ve OE marjinaleri ile birleşik model,
49 ürün/doğrudan uzmanları arasında Hedge ile geometrik harmanlanır; tek BS + tek OE seçilir.
50
51 ### Rejim
52 Çevrimiçi 3 merkezli k-means (flip oranı, dengesizlik; pencere 30), histerezis; REGIME_A/B/C; rejim bazlı doğruluk gerçek sonuçl
53 ardan.
54
55 ### Kalıcılık
56 Her bileşenin kendi blob'u: ModelState (memory, side, stats, lock, undo.N), RegimeState, EnsembleState (eksen başına), Calibrati
57 onState,
58 ModelPerformance (eksen:model). Açılış: durum uyuyorsa devam, daha kısaysa kuyruk yakalama, değilse tam replay.
59 Python: pickle (`py_state.pkl`, `py_side_state.pkl`) ve önek yüklemesi.
```

[Dosya #04/84 – Devam] Proje Yolu: FANLAB_TECHNICAL_NOTES.md (Satır 56 ve sonrası)

```

56 ### Replay / sızıntı
57 `ReplayEngine` her adımda geçmişi `copyOf(i)` ile fiziksel keser; kontrol: sıra, lastKnownRecordId, predictionTimestamp ≤ actual
58 Timestamp.
59 Hata kodları: FAN-E-LEAK-001, LOCK-001/002/003, SEQ-001, STATE-001/002, PY-001, DB-001, REPLAY-001, REC-001.
60 ### Dürüstlük notu
61 Veri neredeyse rastgeledir (yan doğruluk ≈ %50). Bu sistem bir avantaj garantisi vermez; Replay sekmesindeki bootstrap/permutati
62 on
63 sonuçları yalnızca şaşırtıcı ayırt edilebilirlik için tanındır.

```

1 # Code on the Go – Chaquopy Python build fix
2
3 The project uses Chaquopy 15.0.1 with Python 3.11. Chaquopy requires a host Python 3.11 interpreter during the Android build
4 ; this is separate from the Python runtime bundled into the APK.
5
6 The Gradle script now resolves Code on the Go's embedded Termux/Python installation via `TERMUX_PREFIX` when available, then che
7 cks the known Code on the Go prefix and finally falls back to `python3.11`, `python3`, or `python` on PATH.
8
9 If the build still reports `Couldn't find Python`, install/enable Code on the Go's Python/Flask add-on (it provides Python o
10 n the IDE's terminal), restart Code on the Go, and run `:app:assembleDebug` again. No project source changes are required after
11 that.
12
13 You can also explicitly set the executable with:
14
15 ```text
16 -PchaquopyBuildPython=/path/to/python3.11
17 ```
18
19 or the environment variable `CHAQUOPY_BUILD_PYTHON`.

```

1 # GitHub'a Yükleme
2
3 Bu paket FanSuper v1.2 + FAN LAB kaynak kodlarının GitHub'a yüklenmeye hazır halidir.
4
5 ## Önerilen kullanım
6
7 1. GitHub'da yeni bir repository oluşturun.
8 2. Repository'yi Public veya Private seçebilirsiniz.
9 3. Bu ZIP'i bilgisayarda/telefonda açın.
10 4. ZIP'in içindeki proje kökündeki tüm dosya ve klasörleri repository köküne yükleyin.
11 5. Özellikle `.github/workflows/build.yml`, `gradlew`, `gradle/`, `app/`, `settings.gradle.kts` ve `.gitignore` dosyaları yüklen
12 melidir.
13 6. GitHub Actions sekmesinden FAN SUPER Build workflow'unu çalıştırabilirsiniz.
14
15 ## Önemli
16
17 - `build/`, `.gradle/`, `.idea/`, `local.properties`, APK/AAB ve yerel Python ortamları repository'ye dahil edilmemelidir.
18 - API anahtarı, token, keystore veya özel anahtar commit etmeyin.
19 - GitHub Actions workflow'u Python 3.11 kurarak Chaquopy tabanlı Python meclisi için gerekli build ortamını hazırlamayı dener.

```

BÖLÜM 2: Gradle, Derleme (Build), Git ve CI/CD Yapılandırma Dosyaları

11 Dosya · 762 Satır · 70.5 KB

Kök ve modül düzeyinde Gradle Kotlin DSL betikleri, Chaquopy/Python 3.11 yapılandırması, Gradle Wrapper dosyaları, Git öznelikleri ve GitHub Actions iş akışı.

22 #
23 # Gradle start up script for POSIX generated by Gradle.
24 #
25 # Important for running:
26 #
27 # (1) You need a POSIX-compliant shell to run this script. If your /bin/sh is
28 # noncompliant, but you have some other compliant shell such as ksh or
29 # bash, then to run this script, type that shell name before the whole
30 # command line, like:
31 #
32 #     ksh Gradle
33 #
34 # Busybox and similar reduced shells will NOT work, because this script
35 # requires all of these POSIX shell features:
36 #     * functions;
37 #     * expansions «$var», «${var}», «${var:-default}», «${var+SET}»,
38 #       «${var#prefix}», «${var%suffix}», and «$( cmd )»;
39 #     * compound commands having a testable exit status, especially «case»;
40 #     * various built-in commands including «command», «set», and «ulimit».
41 #
42 # Important for patching:
43 #
44 # (2) This script targets any POSIX shell, so it avoids extensions provided
45 # by Bash, Ksh, etc; in particular arrays are avoided.
46 #
47 # The "traditional" practice of packing multiple parameters into a
48 # space-separated string is a well documented source of bugs and security
49 # problems, so this is (mostly) avoided, by progressively accumulating
50 # options in "$@", and eventually passing that to Java.
51 #
52 # Where the inherited environment variables (DEFAULT_JVM_OPTS, JAVA_OPTS,
53 # and GRADLE_OPTS) rely on word-splitting, this is performed explicitly;
54 # see the in-line comments for details.
55 #
56 # There are tweaks for specific operating systems such as AIX, CygWin,
57 # Darwin, MinGW, and NonStop.
58 #
59 # (3) This script is generated from the Groovy template
60 #     https://github.com/gradle/gradle/blob/HEAD/platforms/jvm/plugins-application/src/main/resources/org/gradle/api/internal/
61 #     plugins/unixStartScript.txt
62 #     within the Gradle project.
63 #
64 # You can find Gradle at https://github.com/gradle/gradle/.

185     body: |
186       ## FAN SUPER v${{ steps.package.outputs.version }}
187       - Overlay v1.4: en üstte Kotlin rakam, altında Python rakam, altında KISA yan (B•T / K•Ç)
188       ve en altta nihai çıktı (rakam + yan) – dört satır, aynı mavi kart.
189       - Ayarlar: yüzdelik seçimi (Yedeğe düşme eşiği) artık seçili değeri gösteriyor;
190       değer Float'a düşmeden tam saklanıyor.
191       - Otomatik tek/çift (konformal) kararı artık nihai tahmini ve overlay'i sürüyor:
192       Otomatik / Her zaman çift / Her zaman tek seçimi K/Py/RAKAM satırlarına uygulanır.
193       - Ana ekran ve FAN LAB çift kararda "1/2" gösterir; tek/çift kararı kilit bağlamıyla saklanır.
194       - v1.3 davranışı korunur: kalıcı hafıza, replay, sızıntı koruması, FAN LAB, geri alma.
195
196     **FAN_SUPER_v${{ steps.package.outputs.version }}_build${{ github.run_number }}.apk** → Android uygulaması (release
197     derleme).
198     **FanSuper_v${{ steps.package.outputs.version }}.zip** → çalışan v1.4 kaynakları (Code on the Go / Android Studio iç
199     e aktarımı)
200     + `veri/fan_data_live.csv` (yalnızca eski kayıtlar).
201     **SHA256SUMS.txt** → APK ve ZIP doğrulama özetleri.

2  """
3  FAN SUPER — Python Meclisi (Chaquopy ile uygulamaya gömülü).
4  Kotlin tarafı yalnızca bu modüldeki fonksiyonları çağırır; tüm giriş/çıkış JSON metnidir.
5
6  HIZLI GERİ ALMA
7  -----
8  Eski sürüm her adımda meclisin TAM derin kopyasını (copy.deepcopy) alıyordu:
9  bu hem sayı düğmelerini yavaşlatıyor hem de yalnızca 8 adım geriye izin veriyordu
10 (9. geri almada tüm geçmiş baştan öğreniliyordu → dakikalarca bekleme).
11
12 Yeni düzen:
13 * Üyeler artık paylaşılan dizileri yerinde değiştirmez, bu yüzden "anlık görüntü"
14   yalnızca referans + birkaç küçük kopya tutar (~60 µs, deepcopy'nin ~1/1000'i).
15 * Her adımın görüntüsü `_journal` halkasına, her CK_EVERY adımda bir de
16   `_checkpoints` (dayanak) listesine yazılır.
17 * `undo_to(n)` hedef günlükte varsa O(1); değilse en yakın dayanağa dönülüp
18   en çok CK_EVERY adım ileri sarılır. Tam yeniden öğrenme yalnızca dayanak
19   kapsamının dışına çıkılırsa gerekir (Kotlin tarafı bunu yapar).

3  FAN SUPER — Python Meclisi üyeleri.
4  Tüm değerler 0..3 (kullanıcı sayısı 1..4). Her üye:
5  predict(h) -> np.ndarray(4) (h.n kayıt bilinirken sonraki için dağılım)
6  update(h) (h.n kayıt; son kayıt yeni gelen gerçek sonuç)
7
8  Geri alma (undo) protokolü — fan_super.py hızlı geri alma için kullanır:
9  snap() -> adım öncesi durumun UCUZ kaydı (büyük tablolar kopyalanmaz)
10 can_restore(s) -> bu kayıt hâlâ geri yüklenebilir mi
11 restore(s) -> kayda geri dön, başarı için True
12 Bu üçlüyü tanımlamayan üyeler için `dict(m.__dict__)` sığ kopyası kullanılır.
13 Bu yüzden hiçbir üye paylaşılan numpy dizilerini / listeleri / sözlükleri
14 YERİNDE değiştirmemeli, her zaman yeni bir nesne atamalıdır.

2  """
3  FAN SUPER v1.3 – Python YAN (Büyük/Küçük + Tek/Çift) analiz meclisi.
4
5  Yan tahmini rakamdan TÜRETİLMEZ: bu modül yalnızca iki ayrı yan dizisini öğrenir.
6
7  bs : 0 = KÜÇÜK (SMALL), 1 = BÜYÜK (BIG)
8  oe : 0 = ÇİFT (EVEN), 1 = TEK (ODD)
9  comb: bs * 2 + oe (0 SMALL_EVEN, 1 SMALL_ODD, 2 BIG_EVEN, 3 BIG_ODD)
10
11 Üç üye, her biri üç eksen (bs, oe, comb) ayrı ayrı tahmin eder:
12 * SideKalip – Kalıp analiz 2.0 (en çok 1 farkla bulanık eşleşme + ayna) yan dizileri üzerinde.
13   Hem Büyük/Küçük hem Tek/Çift ekseninde ve birleşik dizide çalışır.
14 * SideNgram – geri çekilmeli (backoff) n-gram geçiş tabloları.
15 * SideLogit – seri/pencere/çapraz-eksen özellikleriyle çevrimiçi lojistik/softmax regresyon.
16   Seri (streak) yalnızca öğrenilmiş ağırlık kadar etkilidir; "artık kesin döner" yok.
17
18 Tüm durum küçüktür (tablolar + ağırlıklar); adım başına anlık görüntü ucuzdur (undo için).
19 Gelecek veriye erişim yoktur: üyeler yalnızca tahmin anında bilinen diziyi görür; gerçek sonuç
20 learn() ile tahminden SONRA eklenir.
